

Implicit type casting- .) It is performed automatically by Java when converting a smaller data type to a larger data type, such as int to double.

.)It is safe because there is no loss of data.

Explicit type casting-.) It is done manually by the programmer using a cast operator, such as (int).

.)It is used when converting a larger data type to a smaller one, which may result in loss of data or precision.

.)Implicit casting is automatic, whereas explicit casting requires programmer intervention.
